Series 76

ISO-UNIVERSAL FITTINGS
SIZES NW 63 TO NW 630
(2½" TO 25")

Process Solutions

WWW.MKSINST.COM

Series 76 ISO-Universal components are a vacuum flanging system for 63 mm to 1000 mm fittings. The dimension criteria are based on requirements established by the International Standards Organization (ISO). There are two flange styles in the ISO-Universal system: Multi-Fastener (MF) and Bolted. The flange family is also called: ISO-MF, ISO-PF or ISO-K. Figure 1 illustrates the components of this flange system.

This catalog features a large variety of components such as elbows, tees, crosses, reducers and adapters having ISO-MF flanges. Currently there is no ISO standard for the flange face to centerline distance in this system. There is however, an industry standard followed by several manufacturers. MKS Instruments follows these standards in designing the Series 76 ISO-Universal components.

There are several advantages in the use of ISO components. One advantage is that the flange is "sexless." The seal is on a symmetrical centering ring that interfaces with two identical flanges. In addition, ISO-Universal flanges are more compact than ASA flanges, which were designed for pressure and are unnecessarily massive for vacuum use. Since these flanges are an ISO standard, they can be used with components from other manufacturers.

Applications

The Series 76 ISO-Universal component system is used in a variety of industries from process manufacturing to semiconductor fabrication to thin film deposition. Some uses in vacuum systems are:

1. Roughing and foreline plumbing for large vacuum systems
2. High vacuum, high conductance, interconnections
3. Modular systems which will be modified frequently
4. Experimental systems in research laboratories

ISO-Universal flange components using elastomer seals are primarily designed for use at subatmospheric pressure. When elastomer seals are used without baking, typical limiting pressures may be around 10^{-6} Torr. Baked systems using Viton can be used to 10^{-8} Torr.

Standard components can be used to a slight over pressure. MF flanges may be used at a maximum pressure of 30 psig if the metal spacer ring is used and the flange clamps are firmly retained.

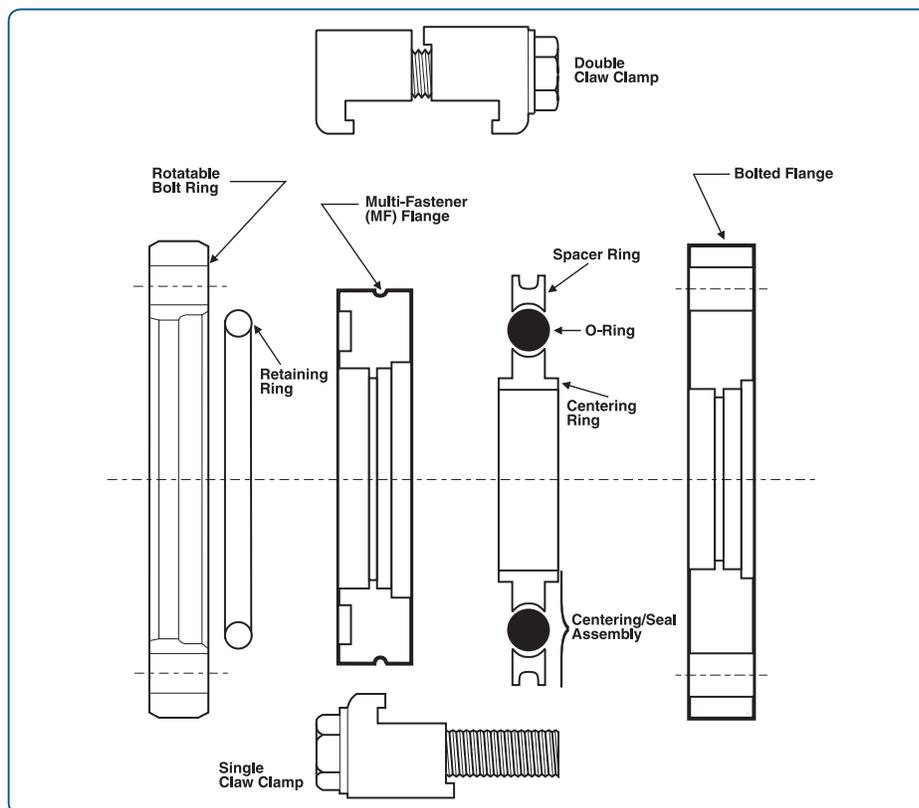

Figure 1 —
Component Nomenclature for the ISO Universal Flange System

Ordering Information

Description

Series 76 ISO-Universal flanges and components in this catalog are made of type 304 stainless steel. Centering ring and seal assemblies are offered with an aluminum centering ring and spacer ring, or with a stainless centering ring and an aluminum spacer ring. Rotatable bolt rings and clamps are made of aluminum alloy. Retaining rings are made of steel.

Flange seal surfaces are carefully machined and inspected for defects. They are cleaned and packaged to remain clean and protected in shipping. The user should observe precaution as required to prevent seal surface harm. This is especially important for used components returned to storage.

Installation

The Series 76 ISO-Universal flange components can be connected in various ways. The figures below illustrate some possibilities. Figure 2a shows a pair of MF flanges retained by double claw clamps. This is usually the most economical arrangement. In Figure 2b an MF flange with a rotatable bolt ring is joined to a bolted flange using nuts and bolts. In Figure 2c an MF flange is joined to a tapped bolt flange using single claw clamps. Tapped flanges are found on some valve bodies. Alternatively, a rotatable bolt ring could have been used with an MF flange to obtain the same result shown in Figure 2c. Last, Figure 2d shows a pair of bolted flanges joined in the usual way by nuts and bolts.

In attaching a rotatable bolt ring to an MF flange as in Figure 2b, the ring is first passed over the flange with the larger bore of the ring facing outward from the open port. The split retaining ring is then snapped into the groove on the periphery of the MF flange. Then the bolt ring is pulled forward into position. Pairs of bolted flanges may also be used.

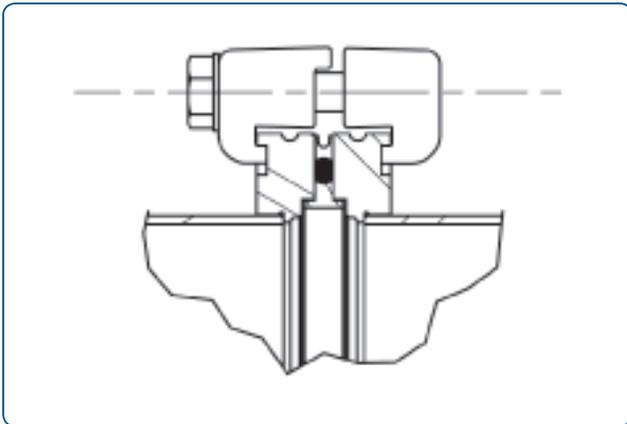

Figure 2a

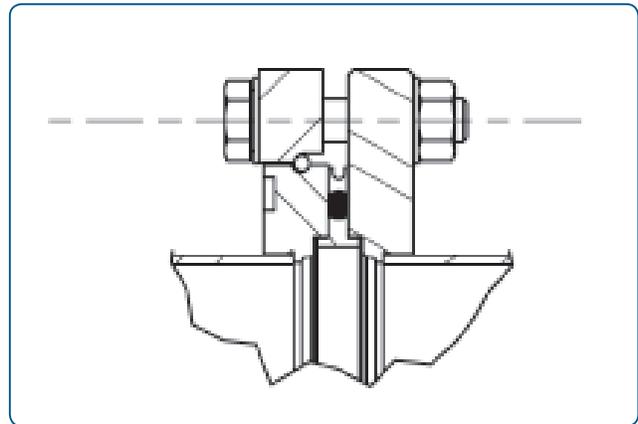

Figure 2b

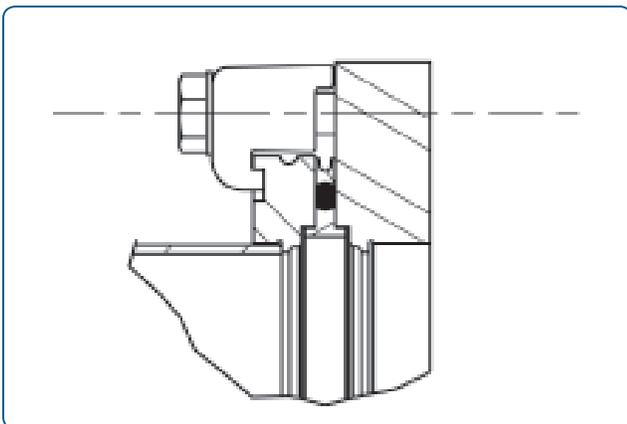

Figure 2c

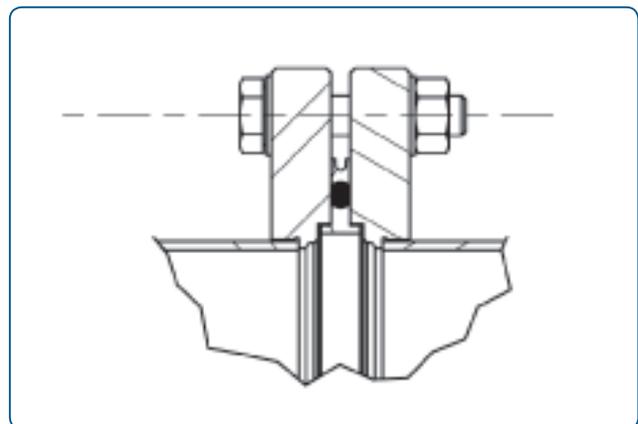

Figure 2d

Figure 3 shows the dimensions of ISO Universal flange components for sizes from 63 to 630 mm, which are standard in this catalog. The maximum size for an MF flange is NW 500, while the bolted flange can run up to NW 1000. The recommended number of clamps to be used with MF flanges are also listed.

Flanges and seals are designed to be tightened to metal to metal contact. It is important that the clamps or bolts not be over tightened or warping of the flanges could result.

The torque rating for clamps and bolts is 7 to 10 pounds per foot.

There are a variety of choices available when selecting centering ring assemblies. Two types of elastomers are available, Buna-N and Viton. Use Viton where temperatures, chemical resistance or long installed life make it beneficial. Use Buna-N where temperatures are moderate, and installed useful life is consistent with this material. The centering ring is available in two types of metal: stainless steel and aluminum. Use stainless steel where chemical resistance is needed.

MKS Instruments presently supplies Series 76 ISO-Universal flanges drilled for inch dimension tubing and pipe. Weld assembly should be by an experienced TIG or MIG welder. Bored flanges have been designed for assembly by internal fusion welding without the use of filler

metal. Tacking is advisable. A weld rotator aides in making attractive welds with minimum warping. Excessive current or non uniform rotation can cause warping of the flange face. When there is a concern about warping, use a flange with a stub. Butt welding to stubs in sizes up to 10 inch diameter with a wall thickness of 1/8 inch can also be by fusion. Internal purge gas will prevent excessive oxidation.

Remove any oxidation by wire brushing. This should be done while the part is still slightly warm, since the oxides are nearly impossible to remove later. Use only a stainless steel wire brush or wheel, since ordinary steel brushes leave iron residue which will then rust.

Since the centering ring grooves on the NW 100 and NW 160 flange happen to be almost exactly the diameters of the tubing to be used with these sizes, the flange can be inadvertently welded on backwards. When working with the MF flange, note that the clamp retaining groove goes to the rear (tube) side. Working with the bolted flange requires more care. Close inspection of the weld prep detail will show the recess from the tube side to have a negligible radius, while there is a small radius visible on the seal side.

The technical staff of MKS Instruments is available to help you with system design and any special needs you may encounter. Call 800-345-1967 for a quotation.
